(AFFILATED TO VISVESVARAYA TECHNOLOGICAL UNIVERSITY BELAGAVI-590018)

A INTERNSHIP PROJECT REPORT ON

“JOB BRIDGE”

Submitted By

AMREEN KHANAM A

2LG21CS002

Under the Guidance of

Prof. VEERESH

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

2024-25

Government Of Karnataka

Department Of Collegiate and Technical Education

GOVERNMENT ENGINEERING COLLEGE TALAKAL, KOPPAL-583238

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

CERTIFICATE

Certified that the Internship Project entitled “**JOB BRIDGE**” carried out by Mr/Ms **AMREEN KHANAM A** USN **2LG21CS002** a Bonafide student of B.E 8th Semester in partial fulfillment for award of Bachelor Engineering in **Computer Science and Engineering** of the Visvesvaraya Technological University, Belagavi, during the year 2024-2025. It certified that all corrections/suggestions indicated for Internal Assessment have been incorporated in the Report deposited in the Departmental Library.

The project report has been approved as it satisfies the academic requirements in respect of Internship Project prescribed for the said Degree.

ACKNOWLEDGEMENT

I consider it a privilege to express a few words of gratitude in depth and respect to all those, who guided and inspired for the successful completion of this seminar.

My sincere thanks to our beloved principal, **Dr. VIRUPAXI BAGODI** Government Engineering College, Talakal, for kind co-operation during our entire course.

I would like to express our immense gratefulness to our beloved Project Guide **Prof.VEERESH**, Department of Computer Science and Engineering, for his guidance and support throughout our seminar work.

I express my sincere gratitude to our beloved HOD **Prof. VEERESH**, Department of Computer Science and Engineering, for major source of inspiration, co-operation and guidance.

I am thankful to all the faculty members of Computer Science and Engineering for their valuable support and co-operation.

I am thankful to our Parents and Friends for their love, encouragement, affection and moral support showered on us during our entire course.

Cordially,

AMREEN KHANAM A

2LG21CS002

ABSTRACT

Traditional methods are often time-consuming and inefficient for both job seekers and employers. To address this issue, Job-Bridge is developed as a comprehensive web-based job recruitment platform that simplifies the process of posting jobs and applying for them. This project aims to create a dynamic and responsive portal where employers can list job openings and job seekers can search, view, and apply for suitable positions. The platform is built using a full-stack development approach with Spring Boot as the backend framework, MySQL as the database system, and HTML, CSS, and JavaScript for the frontend interface. Key functionalities include user registration and login, job posting, job searching, application submission, and application tracking. The system follows a client-server architecture and leverages RESTful APIs to ensure smooth communication between frontend and backend modules. JobBridge ensures a user-friendly experience through an intuitive interface and structured data handling. This project not only enhances technical development skills but also addresses a real-world problem by providing a scalable and efficient recruitment solution. With potential for future upgrades like AI-based job recommendations, mobile application integration, and real-time communication, JobBridge can evolve into a robust tool for modern hiring needs.

CHAPTER 1

COMPANY INFORMATION

This chapter gives brief introduction about company its vision, mission values and inspirer of the company. This also highlights the services offered, products developed by the company. Overview of the Company ParvaM was founded by a team of passionate folks from diverse platforms with the intent of delivering the valued services to keep the future ready with various software solutions with cutting edge technologies in the market. We are here to deliver Quality Technical Products, Development & Services for all your Current and Future software requirements. We are also committed to providing Quality Staffing and Consulting services.

ParvaM has served the customers with a delighting experience with our expert services on a competitive edge in delivering the unique experiences on technology, consulting and software solutions in the areas of implementing enterprise applications, professional web sites, customized applications and technology workshops on a different trending technology.

Vision and Goals

Vision

- To serve a world-class customer experience while delivering the unique software solutions and grow as a leading consulting and staffing solutions provider.
- To emerge as a world class incubation center for Research & Development RpeT DeIng being a platform for innovation.

Mission

Customer Delight: by providing the highest degree of excellence to support the customer and value to their business Superior returns to shareholders: Being a valued business partner Excellence at Knowledge Delivery: Providing the best class training for the resources. Engineering Excellence: Accomplishing the innovative software solutions driven with the competitive engineering and planning. Values We work with Customer First Focus and value, Challenge and Reward our People. Strategy Our Strategy is built on the foundation of our corporate values and will drive our successful development in the coming years to achieve our long-term vision for PARVAM Consul-tech in order to steer the focus of the entire organization towards our strategy and ensure in successful implementation, we have defined four strategic priorities Outperform, Globalize, Simplify, Inspire. Services Software Solutions Consulting/ Staffing Solutions Technology Workshops Research and Development.

CHAPTER 2

INTRODUCTION

The term web development refers to the process of designing, creating, and maintaining websites or web applications. In today's digital era, web applications have become essential tools for bridging the gap between service providers and users. One such vital application is a job recruitment platform, which allows employers to post vacancies and job seekers to apply for positions conveniently.

Job-Bridge is a full-stack web application built to simplify the recruitment process by connecting job seekers and employers on a single platform. The system provides features such as job posting, job search, and application management using modern web technologies. The development involved creating a responsive and functional interface using tools like HTML, CSS, and JavaScript for the frontend and powerful backend logic using Spring Boot and MySQL for the server-side processing.

To achieve seamless user interaction and robust functionality, the application integrates frontend and backend systems effectively, offering both visual and logical components of a complete web-based solution. Through this project, the goal is to demonstrate the practical application of full-stack web development in solving real-world hiring challenges.

2.1 CLASSIFICATION OF WEB DEVELOPMENT

Front-End Development:

Front-end development focuses on the user interface and experience. In the JobBridge project, frontend development was implemented using HTML, CSS, and JavaScript, ensuring that users (both employers and job seekers) have a visually appealing and responsive interface. Users can view job listings, apply for jobs, and interact with the platform seamlessly.

Back-End Development:

Back-end development involves server-side logic, database management, and application services. In JobBridge, the backend is developed using Spring Boot, which handles request processing, API integration, user authentication, and data transactions. MySQL is used to

store job listings, user profiles, and application records. Backend development ensures the correct functioning of job posting, user registration, login, and application submission features.

2.2 FRONT-END DEVELOPER

A Front-End Developer is responsible for implementing visual elements that users interact with within a web application. In the context of JobBridge, the front-end developer creates the user interface that allows job seekers to browse jobs, apply, and manage profiles, and enables employers to post vacancies and view applications.

The role requires translating design and business logic into interactive and responsive webpages. The developer ensures that the website is user-friendly, mobile-compatible, and visually aligned with current design standards.

2.3 SKILL REQUIREMENTS FOR FRONT-END WEB DEVELOPMENT

To build the JobBridge platform's front-end, specific technical and design-related skills are necessary. These skills ensure that the application is not only functional but also user-centric and efficient.

Essential Skills:

HTML: Hyper Text Markup Language (HTML) is the standard markup language used for creating web pages. It is the most basic building block required for developing websites

CSS: Cascading Style Sheets (CSS) is used to apply styles to web pages. It is used to make web pages presentable. The reason for using this is to simplify the process of making web pages presentable. It allows you to apply styles on web pages. More importantly, it enables you to do this independently of the HTML that makes up each web page.

JavaScript: JavaScript is a very powerful tool that can do many things for a website. For one, it powers the site's general interactivity. JavaScript makes it possible to build rich UI components such as image sliders, pop-ups, site navigation mega menus, form validations, tabs, accordions, and much more.

2.4 WORKING OF THE WEBSITE

A website is a collection of interconnected webpages hosted under a single domain name. These webpages provide content and services to users, such as text, images, forms, and interactive features. In the case of the JobBridge application, the website enables users to search for jobs, apply for positions, and manage job postings.

The JobBridge website follows a typical client-server architecture. Users interact with the frontend (browser) which communicates with the backend (server) to retrieve or store data in the database. The entire interaction is facilitated over the internet using HTTP protocols and REST APIs.

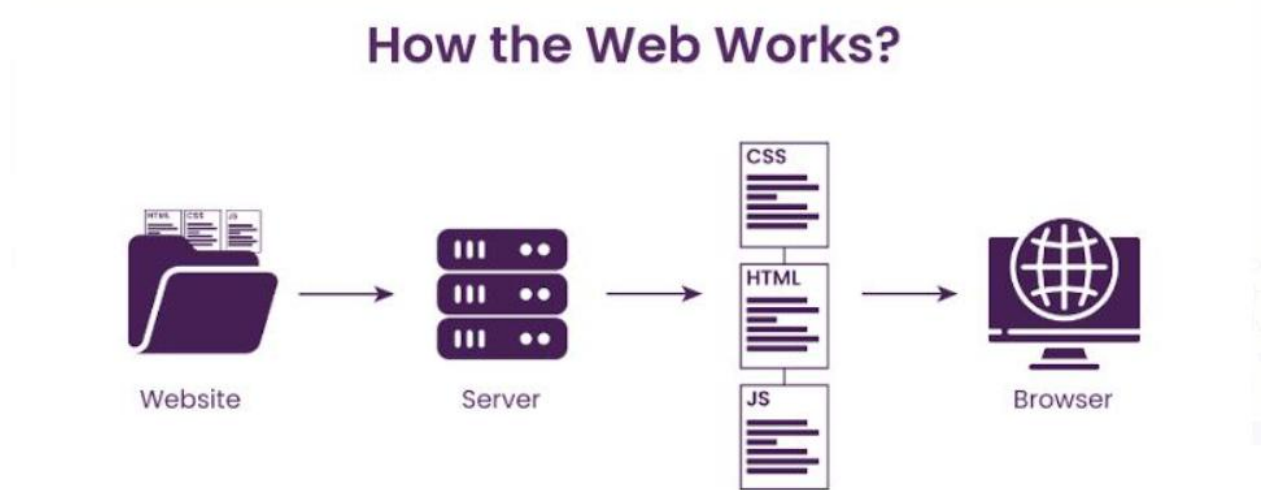

Fig 2.1: Working of Website

CHAPTER 3

REQUIREMENT SPECIFICATION

3.1 Software Requirements

- Operating System : Windows 10 or above
- Software : Microsoft Edge, Chrome
- Database : MYSQL
- Editor : Visual Studio Code
- Web Framework : Spring boot
- Language : Java

3.2 Hardware Requirements

- Ram : 16.00GB
- Processor : Intel Corei5
- Input Device : Keyboard & Mouse
- Output Device : Monitor

CHAPTER 4

IMPLEMENTATION

4.1 Hyper Text Markup Language (HTML)

HTML (Hyper Text Markup Language) is the most basic building block of the Web. It defines the meaning and structure of web content. Other technologies besides HTML are generally used to describe a web page's appearance/presentation (CSS) or functionality/behaviour (JavaScript). "Hypertext" refers to links that connect web pages to one another, either within a single website or between websites. Links are a fundamental aspect of the Web. By uploading content to the Internet and linking it to pages created by other people, you become an active participant in the World Wide Web. HTML uses "markup" to annotate text, images, and other content for display in a Web browser. HTML markup includes special "elements" such as `<head>`, `<title>`, `<body>`, `<header>`, `<footer>`, `<article>`, `<section>`, `<p>`, `<div>`, `<span>`, `<img>`, `<nav>`, `<video>`, `<ul>`, `<ol>`, `<li>` and many others.

Features of HTML:

- 1) It is a very easy and simple language. It can be easily understood and modified.
- 2) It is very easy to make an effective presentation with HTML because it has a lot of formatting tags.
- 3) It is a markup language, so it provides a flexible way to design web pages along with the text.
- 4) It facilitates programmers to add a link on the web pages (by html anchor tag), so it enhances the interest of browsing of the user.
- 5) It is platform-independent because it can be displayed on any platform like Windows, Linux etc.
- 6) It facilitates the programmer to add Graphics, Videos, and Sound to the web pages which makes it more attractive and interactive.
- 7) HTML is a case-insensitive language, which means we can use tags either in lowercase or upper-case.

HTML Page Structure:

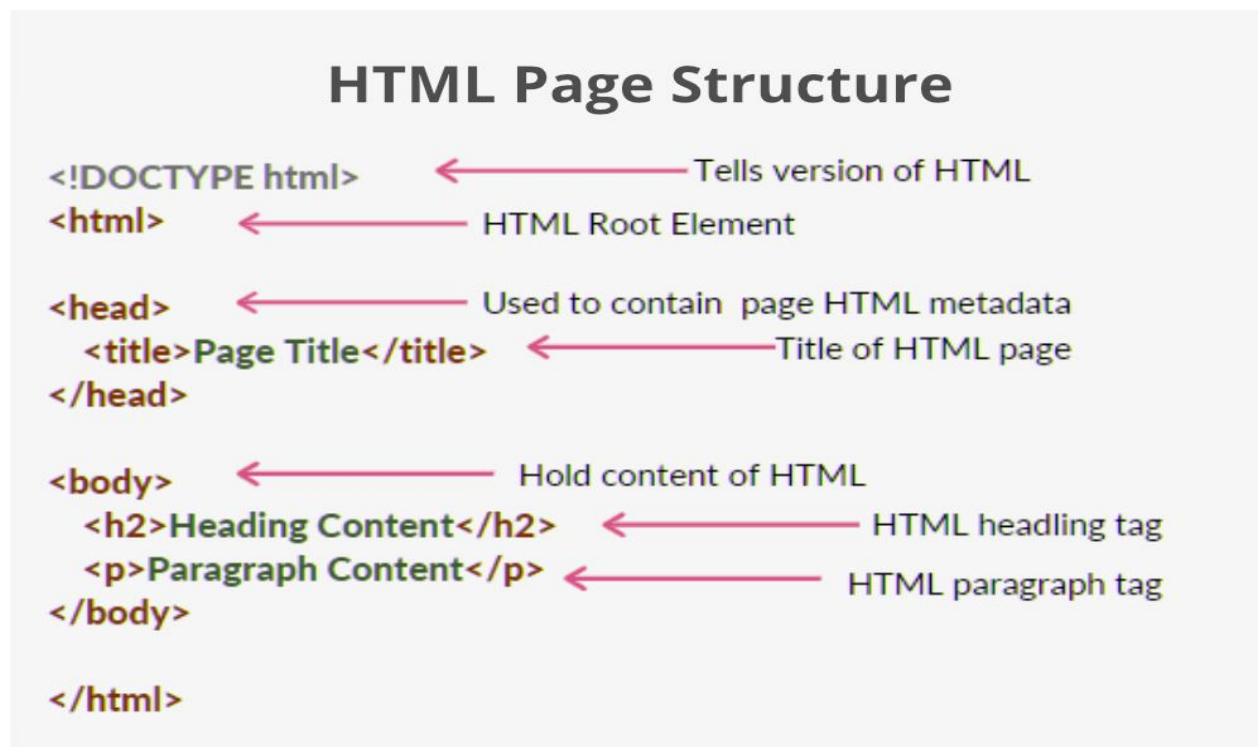

Fig 4.1: HTML Page Structure

<DOCTYPE>: It defines the document type or it instructs the browser about the version of HTML.

<HTML> : This tag informs the browser that it is an HTML document. Text between html tag describes the web document. It is a container for all other elements of HTML except

<HEAD>: It should be the first element inside the element, which contains the meta data (information about the document). It must be closed before the body tag opens.

<TITLE>: As its name suggested, it is used to add title of that HTML page which appears at the top of the browser window. It must be placed inside the head tag and should close immediately.

<BODY>: Text between body tag describes the body content of the page that is visible to the end user. This tag contains the main content of the HTML document.

4.2 Cascading Style Sheets

Cascading Style Sheets are fondly referred to as CSS. It is used to make web pages presentable. The reason for using this is to simplify the process of making web pages presentable. It allows you to apply styles on web pages. More importantly, it enables you to do this independently of the HTML that makes up each web page.

Features of CSS

- 1). Font, color, background style, element alignments, border, and size tags had to be duplicated on each web page before CSS. This was a lengthy procedure.
- 2). CSS makes website maintenance much easier. If we need to make a global change to the file, we can simply alter the style, which will update all of the elements on the web page.
- 3). We can use CSS with older language versions because it is compatible with them. CSS makes it possible to optimize material for several devices
- 4). A website that's dull and plain will not attract the user, so adding some style would surely make your website presentable to the user.
- 5). A website with a simple yet beautiful UI would help the users to go through the website easily. It is used to make the user interface better.
- 6) Since CSS is a basic requirement while learning Web Development, therefor there are abundant career opportunities for it. As a freelancer, you can land up too many projects.

Types of CSS:

There are three types of CSS which are given below: **Inline CSS, Internal CSS, External CSS.**

Inline CSS: Inline CSS contains the CSS property in the body section attached with element is known as inline CSS. This kind of style is specified within an HTML tag using the style attribute.

Internal or Embedded CSS: This can be used when a single HTML document must be styled uniquely. The CSS rule set should be within the HTML file in the head section i.e., the CSS is embedded within the HTML file.

External CSS: External CSS contains separate CSS file which contains only style property with the help of tag attributes (For example class, id, heading, etc.). CSS property written in a separate file with .CSS extension and should be linked to the HTML document using link tag.

Properties of CSS: Inline CSS has the highest priority, then comes Internal/Embedded followed by External CSS which has the least priority. Multiple style sheets can be defined on one page. If for an HTML tag, styles are defined in multiple style sheets then the below order will be followed.

- 1) As Inline has the highest priority, any styles that are defined in the internal and external style sheets are overridden by Inline styles.
- 2) Internal or Embedded stands second in the priority list and overrides the styles in the external style sheet.
- 3) External style sheets have the least priority. If there are no styles defined either in inline or internal style sheet then external style sheet rules are applied for the HTML tags.

4.3 JavaScript

JavaScript (JS) is the world's most popular lightweight, interpreted compiled programming language. It is also known as a scripting language for web pages. It can be used for Client-side as well as Server-side developments. JavaScript can be added to your HTML file in two ways: Internal JavaScript: We can add JS code directly to our HTML file by writing the code inside the `<script>` tag. The `<script>` tag can either be placed inside the `<head>` or the `<body>` tag according to the requirement. External JavaScript File: We can create a file with .js extension and paste the JS code inside it. After creating the file, add this file in `<script src="file_name.js">` tag inside `<head>` tag of the HTML file.

Features of JavaScript

1. All popular web browsers support JavaScript as they provide built-in execution environments.
2. JavaScript follows the syntax and structure of the C programming language. Thus, it is a structured programming language.
3. JavaScript is a weakly typed language, where certain types are implicitly cast (depending on the operation).
4. JavaScript is an object-oriented programming language that uses prototypes rather than using classes for inheritance.

CHAPTER 5

SYSTEM DESIGN

System implementation refers to the process of transforming the system design into a working application using suitable technologies and tools. For the Job-Bridge project, the implementation phase involved frontend development, backend logic development, database integration, API creation, and connecting all components to create a fully functional job posting and recruitment web application.

5.1 METHODOLOGY

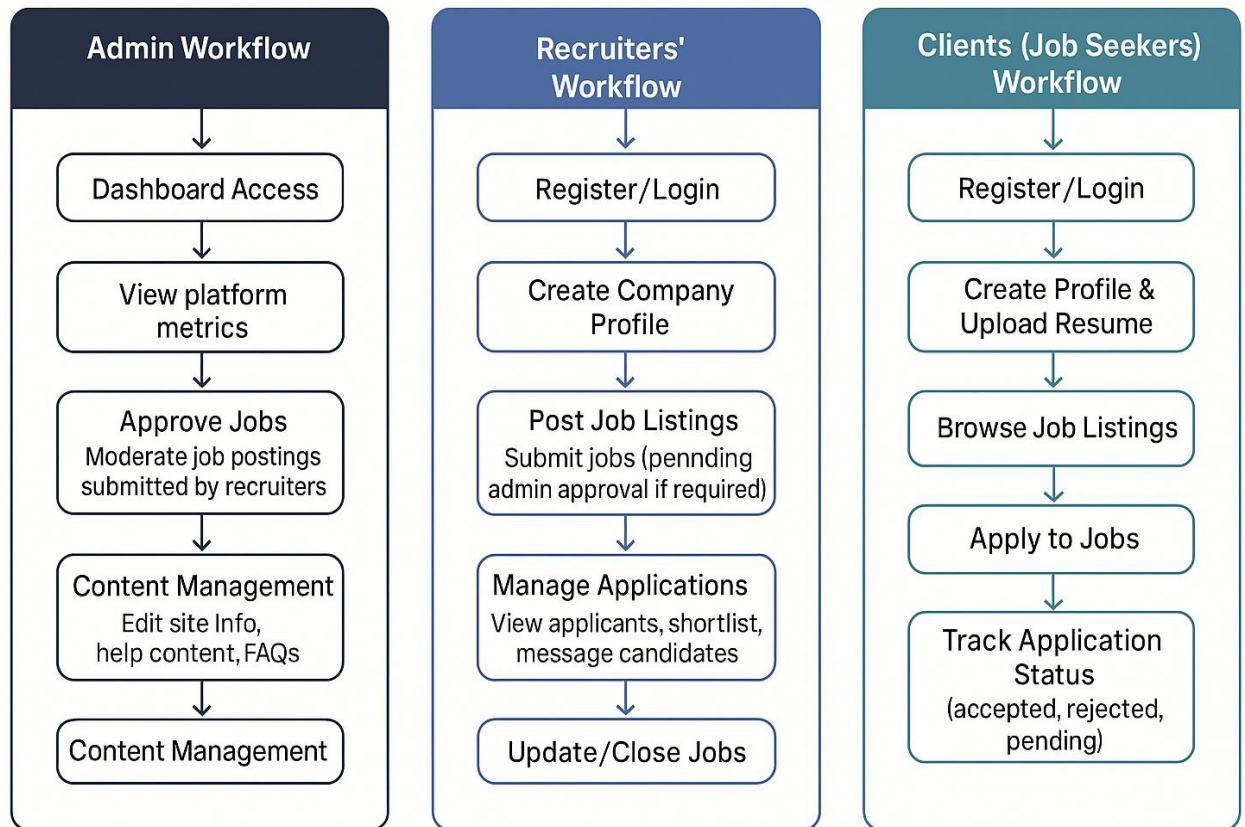

Fig 5.1: Class Diagram

5.2 USE CASE

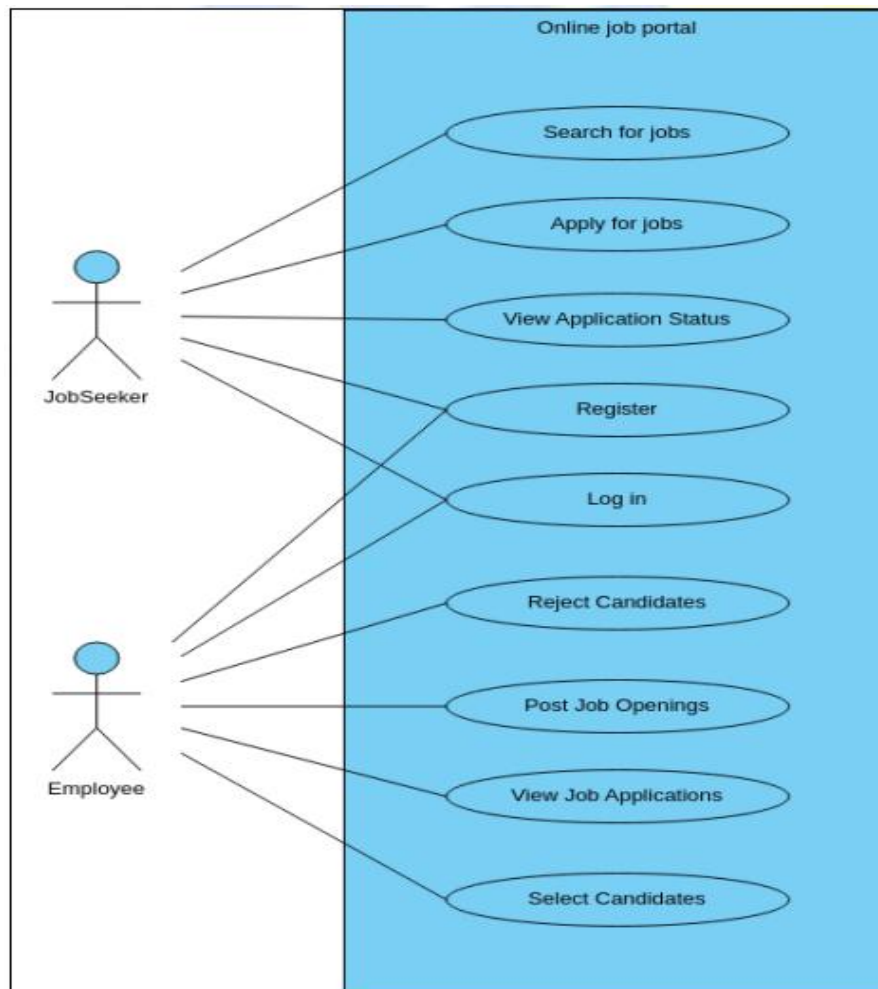

Fig 5.2: Use Case Diagram

- JobSeeker: Can search for jobs, apply for jobs, view application status, register, and log in.
- Employee: Can reject candidates, post job openings, view job applications, and select candidates.

CHAPTER 6

ADVANTAGES AND DISADVANTAGES

Advantages

- **Simplifies job posting and hiring:**

Employers can easily post job openings, and candidates can apply quickly, streamlining the entire recruitment process.

- **Real-time job listing updates:**

Job postings are updated instantly, ensuring users always see the most current opportunities.

- **Customizable and scalable platform:**

The system can be tailored to meet specific business needs and can grow as the organization expands.

- **User-friendly interface for all roles:**

Designed with intuitive navigation, making it easy for employers, applicants, and admins to use the platform.

- **Promotes digital recruitment processes:**

Encourages a shift from traditional hiring to efficient, paperless, and remote-friendly recruitment.

Disadvantages

- **Limited offline functionality for users:**

The platform relies on internet access, which can hinder users in low-connectivity areas.

- **Security risks:**

Storing user and job data online can expose the platform to potential data breaches if not properly secured.

- **Performance can be affected if the database is not optimized:**

A poorly managed or large database can slow down the platform, affecting user experience.

- **Requires continuous update and monitoring:**

To maintain performance, security, and usability, the system needs regular maintenance and improvements.

CHAPTER 7

RESULTS

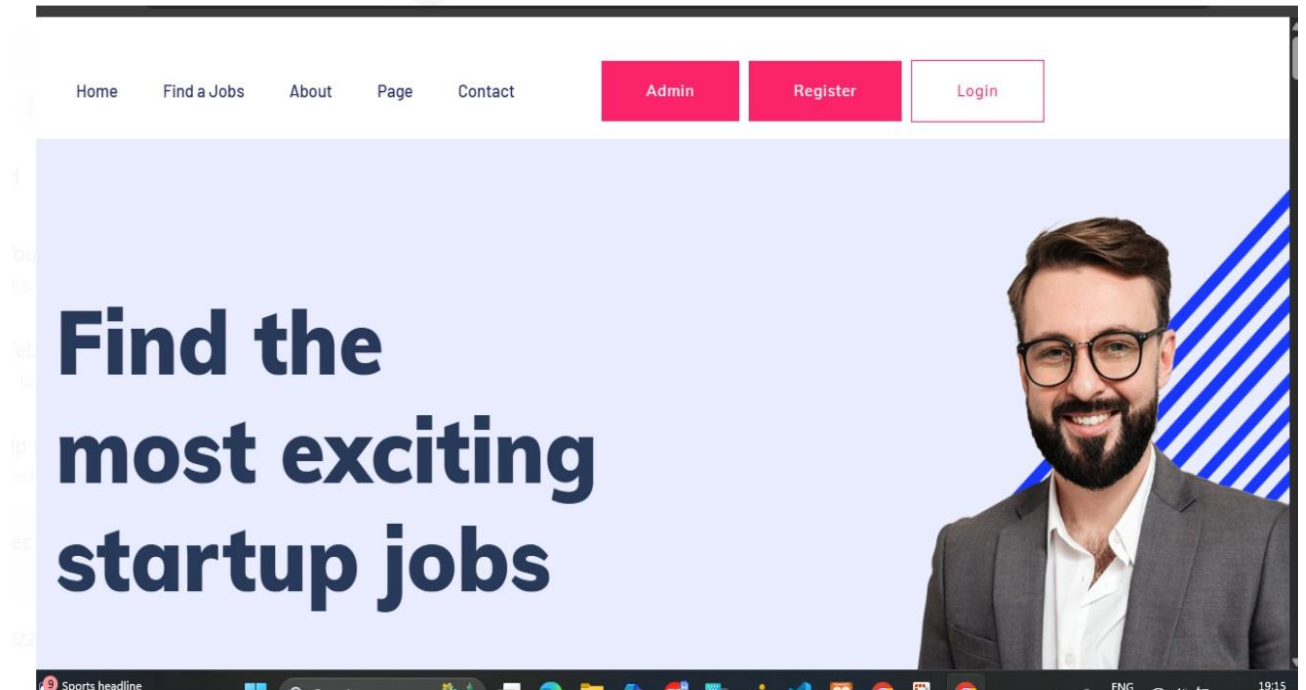

Fig 7.1: Home Page

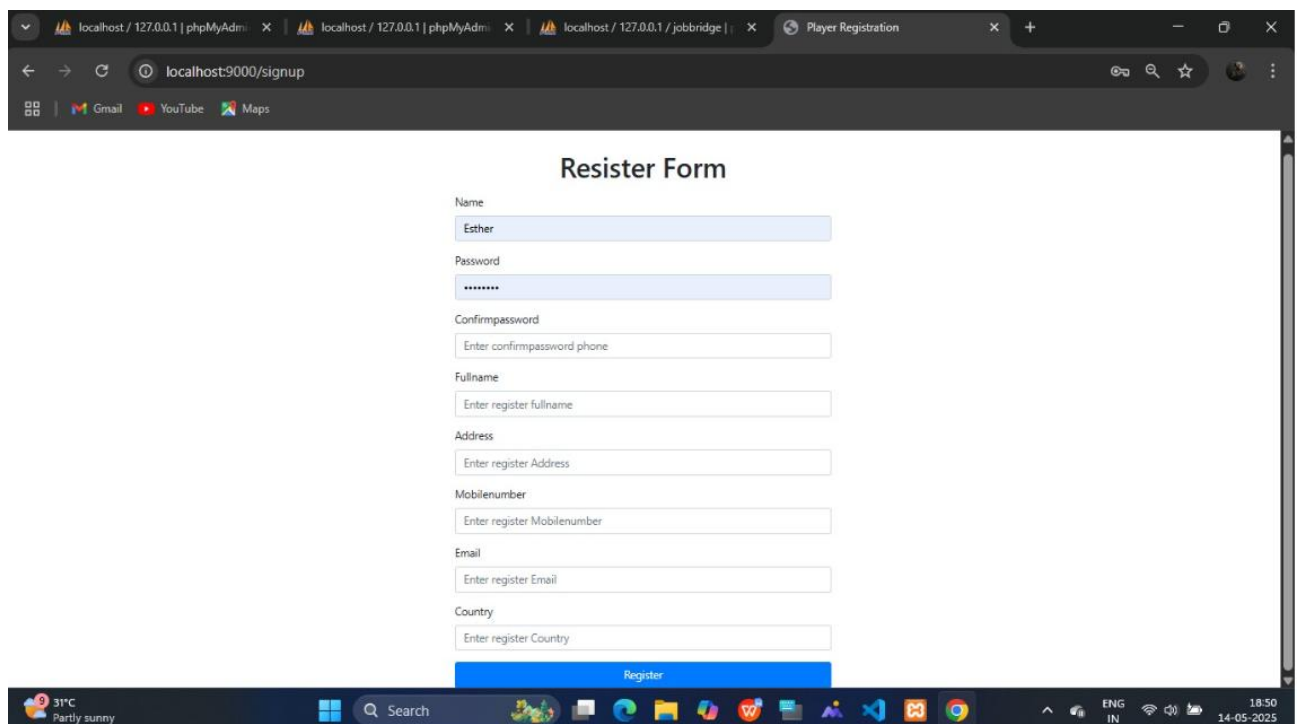

A screenshot of a web browser showing a registration form titled 'Resister Form'. The form is displayed on a white background. It contains several input fields with placeholder text: 'Name' (with 'Esther' entered), 'Password' (with '*****' entered), 'Confirmpassword' (with 'Enter confirmpassword phone' entered), 'Fullname' (with 'Enter register fullname' entered), 'Address' (with 'Enter register Address' entered), 'Mobilenumber' (with 'Enter register Mobilenumber' entered), 'Email' (with 'Enter register Email' entered), and 'Country' (with 'Enter register Country' entered). Below the form is a blue 'Register' button. The browser's address bar shows 'localhost:9000/signup'. The taskbar at the bottom shows the system clock as 18:50 on 14-05-2025.

FUTURE SCOPE

The Job-Bridge platform, in its current state, effectively connects job seekers and employers through essential features such as job posting, application submission, and user authentication. However, there exists considerable scope for future enhancements that can transform it into a more intelligent and user-centric recruitment solution. One of the most promising improvements includes the integration of AI-driven job recommendation systems, which can analyze user profiles, application history, and preferences to suggest the most suitable job opportunities. Additionally, implementing a resume builder and enabling users to upload and manage multiple documents like resumes and cover letters will provide a more complete application experience.

To facilitate smoother hiring workflows, an interview scheduling module with calendar integration and automated email or SMS notifications can be added. A real-time chat or messaging system between applicants and employers would enhance communication and decision-making speed. The introduction of a mobile application for Android and iOS platforms would significantly improve accessibility, making the system usable on the go. From an administrative perspective, a dashboard with analytics and reports can help track user activity, job post performance, and hiring trends, supporting data-driven improvements.

Furthermore, the platform can be expanded to support multi-language interfaces to reach a wider audience and cater to diverse user groups. Social media integration for login and job sharing, along with synchronization with external job portals such as LinkedIn, Naukri, or Indeed, can significantly boost visibility and user engagement. The inclusion of role-based access control and enhanced security mechanisms will also strengthen the platform's reliability and privacy. With these future advancements, Job-Bridge has the potential to evolve into a comprehensive, scalable, and intelligent job recruitment ecosystem suitable for deployment across educational institutions, startups, and enterprise-level hiring systems.

CONCLUSION

The Job-Bridge project successfully demonstrates the design and development of a dynamic web-based job recruitment platform using modern full-stack technologies such as Spring Boot, MySQL, HTML, CSS, and JavaScript. The platform serves as a bridge between job seekers and employers, offering essential features like job posting, user authentication, job application, and application tracking. Throughout the development process, core software engineering principles were applied, including modularity, scalability, and user-focused design.

This project not only improved practical knowledge of full-stack web development but also highlighted the importance of real-world problem-solving in the employment sector. The implementation of RESTful APIs, proper database design, and a responsive user interface reflects a complete end-to-end application development cycle. While the current version includes basic and necessary functionality, the system has been designed with scalability in mind, allowing for future enhancements such as AI-based recommendations, mobile app support, and real-time communication features.

In conclusion, Job-Bridge is a successful attempt to create a reliable and efficient recruitment platform, demonstrating both technical competence and a strong understanding of user needs. With further improvements and deployment, it has the potential to serve as a useful tool for colleges, companies, and job seekers in the evolving digital job market.
